Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a particularly poikilothermic fish, against the bacterial pathogen animals, Phe method is also useful for protecting animals, rickettsial septicaemia (SRS) and other rickettsial pathogen sequence represents an immunogenic epitope of the P. salmonis. The position of also useful for protecting against salmonid protein. The peptide is used to raise rabbit anti-OspA antibodies.

The present sequence is that of BASB113 protein from Moraxella Catarrhalis strain Mc2831 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adults. The invention provides BASB113 polypeptides, and polynucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB113 composition comprising a BASB113 polypeptide, an immunogenic

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX34318 to AAX34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can
                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines secially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.

The invention relates to isolated polynucleotide (I) and CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC intentifying expressed genes. (I) is useful an approached the sequence tags to restore normal activity of (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as ciscular protection of sites expressing (II). (I) and (II) are useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical corrections for sites expressing (II). (I) and (II) are useful for treating corrections of sites expressing (II). (I) and (II) are useful for treating corrections of the polypeptide and polynuclectide sequences have applications in corrections. The polypeptide and polynuclectide sequences have applications in corrections for generating and produce their types of data and products dependent on DNA and correction, but was obtained in electronic format directly from WIPO correction, but was obtained in electronic format directly from WIPO corrections in the printed correction, but was obtained in electronic format directly from WIPO corrections.

                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLI6176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genes from Drosophila and interactions
                                                                                                                                                                                                                                                                                                                                                          The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2179

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions are used as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin agents that are generally difficult to administer, e.g. vitamins, which and hair

                                                                                                                                                                           The spider silk protein contains a basic 34 amino acid repeat. The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AGR(GGX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly conserved and is 8-10-amino acids long. The third segment is (GGX)5 and is 15 amino acids long and is very highly conserved. In most in a silk having lower elasticity.

APPLICATION UNBER: 08/077,600

PILING DATE: JUNE 15, 1993

ATTORNEY/AGENT INFORMATION:

NAME: FLOYD, LINDA AXAMETHY

REGISTRATION NUMBER: 33,692

REFERENCE/DOCKET NUMBER: CR-9389-A

TELECOMMUNICATION INFORMATION:

TELEPHONE: 302-892-8112

TELEPAX: 302-713-0164

INFORMATION FOR SEQ ID NO: 80:
SEQUENCE CHARACTERISTICS:
LENGTH: 303 base pairs

TYPE: nucleic acid

STRANDEDNESS: single

TOPOLOGY: linear

MOLECULE TYPE: DNA (genomic)

                                                                                                                                                                                                                                                                                                                                                                                                                                                         Salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method is used for protecting animals, P. salmonis specific antigen termed OspA, or an immunogenic fragment of a particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting apainst salmonid sequence represents DNA which has been optimised for expression in Escherichia coli to encode the P. salmonis OspA protein. An OspA protein anti-cona antipolar partner is used in a vaccine to create an

                                                    This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a particularly population of a vaccine. The method is used for protecting animals, rickettsial septicaemia (SRS) and other rickettsial diseases. The present a (SRS) and other rickettsial diseases. The present P. salmonis P. salmonis OSPA DNA termed C17E2 optimised for seguence represents P. salmonis OSPA DNA termed C17E2 optimised for expression in Escherichia coli fused to DNA encoding an undefined is used in a vaccine to create an anti-OSPA antibody response.
                                                                                                                                                                                                                         Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -

                                                                                                          This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents DNA encoding the P. salmonis OspA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 200

The method comprises administering an immunogenic amount of a Salmonis specific antigen termed Ospa, or an immunogenic fragment of a particularly poikilothermic fish, against the bacterial pathogen protecting animals, rickettsial septicaemia (SRS) and other rickettsial diseases. The present a PCR primer used in the cloning and optimisation of the P. salmonis Ospa gene. The Ospa gene is used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the

The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals particularly polkilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The preser sequence represents a PCR primer used in the cloning and optimisation of the p. salmonis OspA gene. The OspA gene is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a

                                                                                                                                                                                                                                                                                                     PCR primer #1 used in cloning an optimisation
                                                                                                                                                                                                                                                                                                                                          11-JUL-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                AAF86251 standard; DNA; 111 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method ospA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial diseases. The method is also useful for protecting against salmonid sequence represents a PCR primer used in the cloning and optimisation of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               139 AAAGGCTCTGGTCGTGTGTCGATGGCCATCGGCGGTGCGGTTCTGGGCGGTCTGATTGGC 198

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method ospA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway; promoter; termination sequence; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          06-SEP-2000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EP1033405-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Arabidopsis

This sequence encodes a synthetic spider dragline variant monomer, DP-1B.9. The sequence of the DP-1B.9 polymer is given in AAR99055. The polypeptide monomer is a variant based on a consensus sequence esp. the natural protein [Spider of spider dragline protein DNA sequence may be used in the recombinant production of the subtills. Synthetic analogues of DP1 were designed to mimic the subtills. Synthetic analogues of DP1 were designed to mimic the repeating consensus sequence of the natural protein and the pattern

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC of variation among individual repeats. DP-1B analogues were designed CC by reordering the four repeats within the monomer of DP1A. This CC monomer exhibits all of the regularities of (1)-(5) below. In addition, CC it exhibits a regularity of the natural sequence which is not shared by CC period of the period of the natural sequence which is not shared by CC generally preceded by a repeat in which both GYG and GRG are deleted is CC generally preceded by a repeat lacking the entire poly-alanine repeat, CC with one intervening repeat. The sequence of DP-1B matches the natural CC sequence more closely over a more extended segment than does DP-1A. The CC individual repeats differ from the consensus according to the pattern: CC (1) the poly-alanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence is deleted, CC so also is the surrounding sequence encompassing AGRGGLGGGAGANGG; CC (3) aside from the poly-alanine sequence, deletions usually CC encompass integral multiples of three consecutive residues; (4) deletion of GYG is generally accompanied by deletion of GRG in the same sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
